¹⁾ Other anchor diameters on request

²⁾ Steel, galvanised

³⁾ TSM-ST: M8; TSM-IM: M8; & M10; all other TSM variants have no connection thread

⁴⁾ in cracked and Uncracked concrete

⁵⁾ Bright zinc galvanising

Functional principle of anchorages

Functional principle	Description	Representation	Advantages / disadvantages
Frictional connection	During the installation process, the Mesh sleeve is expanded in a controlled manner to ensure a secure fixation in the drill hole through friction between the anchor and the concrete. A distinction is made between displacement-controlled expansion, in which the assembly process is ensured by targeted deformation using a rod fitting accessory, and torque-controlled expansion, in which an applied torque is used to expand the expansion sleeve using the conical geometry of the anchorage.		+ Anchor can be used and loaded immediately after installation + Easy installation + Self-locking fixation by spreading the expanding sleeve - High expansion forces in the concrete lead to larger centre and edge distance - No dismantling of the anchor - Frictional connection does not work in conjunction with building materials that are sensitive to expansion pressure (e.g. perforated brickwork)
	During installation, a positive fit is created between the anchorage and the concrete. The special toothing on the cutting edges of the TSM screwbolt forms the threads in the concrete. The resulting positive fit fixes the TSM screwbolt securely in the concrete.		+ TSM screwbolt can be used and loaded immediately after installation + Low expansion forces enable use close to edges and axes + Complete disassembly/vollständige Demontage + The positive fit is created by screwing in the TSM screw anchor (no special tools required)
	The resin injection cartridge used to fill the drill hole firmly connects the anchorage to the concrete. The chemical anchor forms a material connection with the anchoring base that is difficult to release.		+ Highest load-bearing capacity + Expansion-free fastening ensures small edge and centre distances + also works in conjunction with the mesh sleeve in hollow building materials - Curing time depends on humidity and temperature - Assembly-sensitive in the area of drill hole cleaning - No dismantling possible

Single / multiple fastening

Single fastening

If an anchor fails, the stability of the system is jeopardised. impaired.

Multiple fastening

If an anchor fails, the standard safety of the system is not impaired (redundant systems). The load is redistributed to neighbouring anchorages. However, the serviceability may no longer be guaranteed (e.g. visible changes to the anchor).

According to ETAG1, Part 6, a multiple fastening of non-load-bearing systems exists if a pipeline has **at least 3 fastenings** and the load **per point** is **a maximum of 2kN**.

¹⁾ ETAG = Guideline for European Technical Approvals (ETA)

Bolt anchor AN BZ plus

The universal genius

- Approved for use under seismic conditions of categories C1 and C2 (M8 - M20 and max. anchor length 210mm)
- Suitable for front, through and spacer mounting
- Wide range of applications (use with siFramo, Siconnect, pipe supports, etc.)

ADVANTAGES

- ✓ Cost and time savings when installing with reduced anchoring depth
- ✓ Highest loads (up to 11.9 kN for M16) when installed with standard anchoring depth
- ✓ When using a suction cup, it is no longer necessary to blow out the drill hole

Installation example

1. **AN BZ plus:** mounted with standard anchoring depth and small clamping thickness
2. **AN BZ plus:** mounted with reduced anchoring depth and large clamping strength
3. **AN BZ plus s:** only with reduced anchoring depth and small clamping thickness

Installation

Drop-in anchor AN ES

The Standard

- Suitable for front mounting
- Installation is carried out by hammering the anchorage into the drill hole using a hand or machine expansion tool

The web at the upper end of the anchor sleeve prevents it from slipping down

Maximum load-bearing capacity due to the spreading of the four metal leaves and the resulting pressure of the leaves against the Borehole wall

Fewer reinforcement hits

Reinforcing steel level At

least 20 mm
up to 55 mm distance

Reinforcing steel is covered with at least 20 mm of concrete. With an anchoring depth of 25 mm, reinforcement hits are significantly reduced.

ADVANTAGES

- ✓ Quick and effortless installation when using drill bits
- ✓ Visual assembly check using marking setting tool

Installation

Easier installation

Force-saving assembly when using the ASW plug-on setting tool.

Rod fitting

Expansion mandrel
ANT MSH

Setting Tool for Drop-In
Anchor ANT

Screwbolt TSM-S

The flexible one

- Cuts a thread when screwed into the concrete to create a positive-locking connection
- Enables fastenings close to the edge thanks to the expansion pressure-free operating principle
- Various head shapes enable versatile application options

ADVANTAGES

- ✓ Can be used flexibly thanks to up to three different screw-in depths
- ✓ Quick push-through assembly with impact wrench without torque control
- ✓ Adjustable to compensate for unevenness (Ø8-14 mm)

Diversity

In addition to the TSM-S screwbolt, we also have other screwbolts in our range:

TSM LP

With lens head for fastening in the rail slot

TSM-IM

With internal thread for direct connection of threaded rods

TSM-ST

With M8 external thread for direct connection of additional components

Installation

Nail anchor AN

The fast one

- Installation is carried out by hammering the anchorage into the drill hole
- Reliable frictional connection due to re-spreading of the perfo sleeve
- Suitable for pre-assembly

ADVANTAGES

- ✓ Quick and efficient installation of the anchorage
- ✓ Small drill hole depth (35mm) reduces the risk of hitting the reinforcement
- ✓ Flexible connection options thanks to the M8 / M10 combination thread

Installation

Sectional view

Visualisation of the existing threaded connections of the Coupling Cross Section

Bolt screw BSCR

The Solid

- Suitable for pre-assembly
- Simple screwing in using Torx T25 drive
- Further mounting options using an open-end spanner:
M8 = Spanner size 6 and M10 = Spanner size 8
- Reuse of the BSCR bolt screws is possible

VORTEILE

- ✓ Quick and easy installation
- ✓ Direct connection options thanks to the metric connection thread (M8 or M10; depending on version)
- ✓ Enables wood applications

Installation

ANA universal plug for every building material

For bolt screw M8

ANA 10 x 50, art. no. 402432

For bolt screw M10

ANA 12 x 60, art. no. 402433

Assortment overview

DIN EN 1992-4

and the history of the design procedures

The introduction of DIN EN 1992-4 has made it possible to merge the various design guidelines from the field of subsequent fixing in concrete. As a result, there is now only one standard that regulates the design of fixings in concrete.

Anchor verification with our design software

As part of our anchor design software, it is still possible to carry out a design in accordance with ETAG 001. This option only applies to the subsequent or control design of existing buildings or to the verification of construction projects abroad, in accordance with the building regulations in the respective country.

Load values

Information on edge and centre distances

c_{cr} Describes the characteristic edge distance according to the approval - i.e. from the edge of the component to the fixing point

s_{cr} Describes the characteristic centre distance regulated in the approval - i.e. the distance between two fixing points.

Bolt anchor AN BZ plus

Extract from the conditions of use of the European Technical Assessment ETA-10/0259

Permissible loads according to EN 1992-4 without influence of centre and edge distances. Overall safety factor is taken into account (γ_M and γ_F).

Extract from the conditions of use of the European Technical Assessment ETA-16/0656

Use as multiple fastening of non-load-bearing systems. Permissible loads according to EN 1992-4 without influence of centre and edge distances. The total safety factor is taken into account (γ_M and γ_P). The maximum permissible load per fixing point may be less than the permissible load of the anchor, depending on national regulations.

Nail anchor AN N

Extract from the conditions of use of the European Technical Assessment ETA-11/0240

Use as multiple fastening of non-load-bearing systems. Permissible loads according to EN 1992-4 without influence of centre and edge distances. The overall safety factor is taken into account (γ_M und γ_F). The maximum permissible load per fixing point may be less than permissible load of the anchor, depending on national regulations.

Technical data	Galvanised steel nail anchor ¹				
Anchoring depth		h_{eff}	mm	25	30
Permissible load ²	C12/12	per. F	kN	1.43	1.9
	C20/25 - C50/60	per. F	kN	2.14	2.81
Permissible bending moment		per. M	Nm	5.3	5.3
Minimum component thickness		h_{min}	mm	80	80
Assembly data					
Borehole diameter		d_0	mm	6	6
Borehole depth		h_1	mm	35	40

¹⁾ If shear force is present, a verification for shear load with lever arm must be carried out.

²⁾ With an edge distance of $c_{or} \geq 100$ mm and a centre distance of $s_{cr} \geq 200$ mm. In the event of deviations in the centre and edge distances, the approval values must be consulted.

		Maximum tensile load [kN] in the event of fire for fire resistance classes				
	Document	Size	R 30 (30 min)	R 60 (60 min)	R 90 (90 min)	R 120 (120 min)

		N $h_{ef} = 30$	0.80	0.70	0.60	0.60

Our services

- ✓ Anchor design software
- ✓ Extraction tests on the construction site with an unsettled substrate
- ✓ Construction site
- ✓ Installation instructions
- ✓ CAD library
- ✓ Planning support

You can find our complete range of anchors in our e-catalogue **Siconnect** in the chapter **"Fixings & Fastenings"**.

Further information on our Chemical anchors can be found in a separate brochure.

Anchor design software

- Intuitive user interface with clear input
- Calculation of near-edge fixings and anchor groups
- Design in accordance with the European Technical Assessments of Sikla products and the European Design Methods EN 1992-4, ETAG 001 Annex C, ETAG 029 Annex C, ETAG 001 Part 6, Technical Reports TR 020,
- TR 029, TR 045 and TR 061
- Detailed result display
- Comprehensible expression

Surface of the Sikla Anchorage measurement programme

Design in masonry

Design of chemical Sikla anchors in masonry possible without problems.

Result of dimensioning in concrete

Clear and detailed presentation of the result of the dimensioning.

Print preview

Optimised print display for passing on the design
